SARAS — Week 7 Client Presentation and Prototype Demonstration Transcript

Module: CET257 Enterprise Project
Deliverable: Task A7 — Presentation of Initial Solution Ideas and Prototype to Client
Date: Monday, 31 August 2026
Time: 14:00 – 14:20 NPT (Total recorded duration: 19 minutes 45 seconds)
Location / Platform: Microsoft Teams Video Conference
Recording Reference: `week-7-presentation-enhanced-v2`

Attendees and Roles

- **Mr. Ninson Lama** — Client Representative, Managing Director / Operations Partner, Autoport Pvt. Ltd.
- **Rijan Kapur Poudel** — Project Manager & Technical Architecture Lead, Team SARAS (Presenter: Problem Context, Architecture, Live Prototype Demo, Q&A)
- **Sushank Jung Rawal** — Deputy Project Manager & UI/UX Frontend Lead, Team SARAS (Presenter: Client Requirements, Educational Foundations, Learning Cycle, Value Proposition, Roadmap, Q&A)

Technical Demonstration Environment

- **Live Deployed Prototype URL:** `https://saras-web-eta.vercel.app`
- **Demo Learner Account:** `tester@saras.dev`
- **Demo Access Passcode:** `111111`
- **Target Industry Scenario:** Autoport Logistics and Warehouse Facility, Kathmandu, Nepal

---

Verbatim Presentation Transcript

[00:00:00] Rijan Kapur Poudel:
Good morning everyone, and a very warm welcome to Mr. Ninson Lama from Autoport. I am Rijan Kapur and with me is Sushank Jung Rawal.

Over the past seven weeks, I have focused on project coordination, backend architecture, and authentication, while Sushank has led our user experience and frontend interface.

When someone walks into a busy logistics floor for their very first shift, they may know the rules from a handbook, but in a fast-moving depot, hazard recognition has to happen in seconds. SARAS is built to bridge that gap, giving workers a way to practice spotting real risks in a browser before they face them on the floor.

SARAS is a browser-based safety learning platform focused on pre-shift preparation. We are not replacing practical site supervision or certified instruction; we are reinforcing it. Traditional induction relies heavily on static text and multiple-choice quizzes that don't test spatial awareness. SARAS creates a connected loop: bite-sized lessons, an interactive 360-degree hazard scene, and immediate explanatory feedback.

For Week 7, we are not presenting wireframes or abstract concepts. We have built a functional end-to-end prototype to walk through the requirements guiding this build. I will now hand over to Sushank.

[00:01:45] Sushank Jung Rawal:
Hello everyone. Thank you, Rijan.

From our initial consultations, three priorities shaped our designs:

1. **Clean for the learner:** Warehouse staff need quick, accessible modules on their phone or laptop without clunky logins or complex menus.
2. **Visible for admins:** Safety managers will eventually need oversight of completion. We've designed for that future roadmap, but prioritized the core learner experience for this milestone.
3. **Relevant to operations:** We chose fire safety as our initial focus because clear exit pathways and electrical safety are critical, everyday operational priorities.

To ensure our approach was grounded, we drew on key educational principles:

- First, **retrieval practice**: Learners commit to a judgment before seeing the answer, which cements recall.
- Second, **explanatory feedback**: Studies like Chi et al. show that stating "correct" or "incorrect" isn't enough; learners need the underlying safety reasons.
- Third, **progress ergonomics**: Following research by Sailer and Hense, we avoided distracting, superficial badges, focusing instead on clean, transparent progress tracking.

While literature guided these choices, evaluating whether they transfer to measurable retention on-site is the focus of our next phase.

We translated this into our five-step learning cycle: **See, Spot, Decide, Understand, and Return**. The learner encounters a workplace scenario, spots a hazard in a 360-degree environment, makes a decision, receives explanatory feedback, and can return to revisit concepts without penalty until confident.

SARAS unifies this into three linked stages inside the browser:

- First is **Understand**: Short, focused micro-lessons.
- Second is **Recognize**: Immersive 360-degree panoramic inspection with zero specialized VR hardware.
- Lastly, **Review**: Assessment checks with immediate feedback and live progress saving.

Now, Rijan will demonstrate the exact journey running live in our prototype.

[00:04:30] Rijan Kapur Poudel (Live Prototype Demonstration):
Okay, let's follow one learner and start the demo.

Currently, any user or learner can go to this site— `saras-web-eta.vercel.app` —and see this landing page. We can log in. User accounts will eventually be provisioned by administrators, but that automated feature doesn't currently exist; we are going to build that in the next iteration. For now, we seed and manage accounts directly in the database.

Let's test one account: `tester@saras.dev`, password `111111`. Let's sign in.

Okay, now we are in the dashboard. This is the main learner hub—where you can decide where to go, click "Start Training", see what is up next, and view your progress to see what items are left. If you are enrolled in two or more courses, you can see them right here. The navigation links provide direct access to courses, the Hazard Hunt, the final assessment, the theme toggle, and sign out, or you can return to the landing page.

Let's look at the courses. We have mapped out courses including Fire Safety, Hazard Perception, Working at Height, and Manual Handling. As agreed, Fire Safety is our fully implemented, end-to-end module, while others will be populated in subsequent sprints.

Let's open Fire Safety. Here we can see our progress. This module is organized into structured chapters: Fire Classes, Hazard Identification, and Emergency Response, with all sources and credits clearly attributed. Let's continue.

In "Types of Fire", each unit is structured for easy navigation. Subsequent units remain locked until prerequisite sections are completed, guiding the learner sequentially while still allowing navigation between unlocked chapters.

Let's watch the lesson. Here in "Emergencies at Work", we incorporate video material from the US CDC and safety agencies.

Below, we have active retrieval exercises: match the fuel to the fire class—cardboard box to Class A, petrol containers to Class B, propane cylinder to Class C. We have just learned this information, and now we practice the exact concepts we just covered.

Here we have varied question formats: multiple choice, fill in the blanks, and match the following. Let's make an intentional mistake on this question and submit. As you can see, the system doesn't just fail you; it provides immediate explanatory feedback showing which answers were correct and why, and allows you to resubmit. Now let's resubmit it correctly. We have completed this lesson. This is just one example of our interactive exercises, designed to be much more engaging than simply reading a passive safety handbook.

Now let's start the Hazard Hunt. Here you can see a panoramic 360-degree view representing the Autoport logistics and warehouse facility. The learner must find hazards against five checklist items. You can navigate and look all around the scene.

Hazards are marked by interactive hotspots. When you click a hotspot, you get detailed information explaining the risk and the appropriate corrective action—such as "Stop and Isolate". Active hotspots include an exposed electrical wire, unsealed chemical storage, and a missing fire extinguisher location where an extinguisher should have been mounted.

Now let's navigate back to the module. Here is the final assessment section: there is a pool of comprehensive questions, and passing will generate a course completion certificate—the certificate generation logic is scheduled for the upcoming sprint.

To show another quick example, let's open Working at Height. Starting the lesson, you can navigate through the content: "Inspect from inside, stop and isolate", check answer—correct. In the next question: "About four meters down"—submit test. If it's wrong, it shows the correct answer with immediate feedback. We are not just trying to test them; we are teaching them.

Now let's go back to the dashboard. You can see the updated progress reflected across the courses. Finally, we can sign out. Signing out returns us to the landing page, where an unauthenticated visitor sees the public overview, while registered trainees can sign in.

That concludes the live walkthrough.

[00:09:30] Sushank Jung Rawal:
Thank you, Rijan. We have walked through the entire learner journey. Having a functional build at Week 7 shifts our collaboration with Autoport from abstract discussions to concrete evaluation. We can now test

real user flows, observe where wording can be simplified, and refine the interface based on actual operational feedback.

The complete learner loop—Log in, Understand context, Explore the 360° environment, Recognize hazards, Respond, and Review explanatory feedback—is fully tracked in real-time. In subsequent iterations, we plan to incorporate purposeful progress incentives to encourage ongoing engagement.

Now, why consider SARAS? For Autoport, SARAS fills the critical gap between static paper checklists and cumbersome enterprise LMS platforms:

- **Relevant:** Grounded in everyday warehouse scenarios like pallet clearance, unobstructed fire doors, and emergency access.
- **Connected:** Theory micro-lessons, 360-degree visual practice, and progress tracking happen in one seamless web application.
- **Accessible:** Operates on workers' existing smartphones, tablets, or depot laptops with zero hardware expenditure and no native app installation required.

To be clear about where we stand: what Week 7 proves is that our technical architecture is sound. The learning engine, 360° Hazard Explorer, and persistent progress tracking are functional. What remains to be proven is measured learning retention and tangible impact on safety behavior on the warehouse floor. Proving that requires structured testing with real learners, which directly defines our next milestone.

Rijan, please pass to slide 11.

Our upcoming evaluation focuses on two practical core questions:

1. **Usability:** Can a newly hired warehouse operative navigate the module independently on their phone without confusion or external assistance?
2. **Understanding:** After completing the module, can the worker clearly articulate why a condition is hazardous and identify it in a physical warehouse setting?

We plan to establish baseline usability, observe learner behavior, and incorporate iterative improvements.

To answer this ahead of our final Week 12 delivery, we propose a focused three-part pilot with Autoport:

- **People:** Pilot with a targeted cohort, such as incoming new recruits or warehouse induction refresher groups.
- **Context:** Review scenario scripts with Autoport safety officers to guarantee complete alignment with company terminology and Standard Operating Procedures (SOPs).
- **Value:** Observe task completion, collect user feedback, and measure hazard recognition confidence before workers begin their first shift.

We started with the challenge of preparing a worker before their first shift. SARAS turns passive compliance reading into active, browser-based practice. Week 7 gives us a solid, working foundation; a structured pilot will ensure it delivers genuine on-site value.

We now warmly invite Mr. Lama's questions and feedback.

Client Q&A and Feedback Session

[00:13:40] Mr. Ninson Lama:
Yes, I do have some questions. Thank you, both of you guys—Rijan and Sushank. It was a very wonderful presentation from you guys. As you have talked through the presentation, I would like to ask a question about the workers: if they complete 100% of the training, are they certified to work on the warehouse floor?

[00:14:05] Rijan Kapur Poudel:
Actually, the answer is no. SARAS is strictly a pre-shift preparation and hazard awareness tool, not a practical qualification. It helps workers spot risks and understand safety rules before they step onto the floor. Hands-on equipment instruction, physical walkthroughs, and supervisor sign-offs remain mandatory and separate. Does that answer your question?

[00:14:40] Mr. Ninson Lama:
Yes, that is a very clear and appropriate answer. For the next question: do workers need a high-end computer, an installed app, or VR headsets to use this prototype?

[00:15:00] Sushank Jung Rawal:
The simple answer is no. No special hardware is required. SARAS runs completely inside standard web browsers—whether that's Chrome, Safari, or Microsoft Edge. It works on depot tablets, office laptops, or workers' own smartphones. The 360-degree hazard scene uses standard web graphics (WebGL), so no software downloads or VR goggles are needed.

[00:15:35] Mr. Ninson Lama:
I see, thank you very much for your wonderful answer. Now, what does "Completed" mean on the dashboard, and what happens if someone fails an activity or test?

[00:15:55] Sushank Jung Rawal & Rijan Kapur Poudel:
Thank you for asking; that is an important point. Course completion requires finishing all micro-lessons, inspecting all required hazard hotspots in the 360-degree scene, and passing the assessment. If a learner answers incorrectly, the system does not simply give a failing grade and lock them out. It provides immediate explanatory feedback showing why the selection was unsafe, and lets them review and reattempt until they genuinely understand the concept.

[00:16:40] Mr. Ninson Lama:
Okay, that's a nice explanation. Thank you very much again, Sushank. I would like to ask about using photos of our actual depot and our specific company warehouse in the 360-degree sphere?

[00:17:00] Sushank Jung Rawal & Rijan Kapur Poudel:
The answer is yes. The platform is architected so content and imagery are easy to swap over time. What we can do is take 360-degree panoramic photos directly inside Autoport's warehouse bays, set interactive hotspots on your real high-risk areas, and align the feedback directly with your company's Standard Operating Procedures.

[00:17:35] Mr. Ninson Lama:
I see. Wonderful, so we can really use our own warehouse photos. Nice. Rijan, how do managers see who finishes the training and who is struggling?

[00:17:50] Rijan Kapur Poudel:
The database already logs every interaction—what each learner does, their scores, timestamps, and inspected hazard hotspots. A dedicated supervisor dashboard is scheduled for the upcoming sprint. Right

now, we haven't built that visual admin portal yet, but the underlying data is already recorded so managers will be able to oversee progress, review completion rates, and identify learners who need support without exposing extraneous personal details.

[00:18:25] Mr. Ninson Lama:
Okay, that's very clear. Now, an important question: why use SARAS instead of our standard safety handbook, given we already give workers a safety handbook? Why switch to SARAS?

[00:18:45] Sushank Jung Rawal:
The simple answer is that reading a rule in a handbook is passive, but spotting a hazard in a busy warehouse requires active spatial awareness. SARAS forces workers to actively scan a realistic 360-degree environment and make decisions in context. Immediate explanations reinforce why a regulation exists, building stronger, safer habits before workers face hazards on the physical warehouse floor.

[00:19:25] Mr. Ninson Lama:
Nice. Okay, last but not least, Rijan: what parts of what you showed today are working live right now, and what is the plan for the future?

[00:19:40] Rijan Kapur Poudel:
Currently, as we showed in the demo, user authentication and login are real. The user accounts are currently seeded in the database by me manually; in the next sprint, we will build the admin management portal so an administrator can create supervisors and learners directly. The dashboard is live and real, and progress tracking is real and stored in the database. All lesson contents are research-crafted, and the 360-degree environment is a high-resolution panoramic sphere rendered in real-time WebGL. For the future, we plan automated supervisor reporting, certificate generation, and secondary modules.

[00:20:15] Mr. Ninson Lama:
Thank you very much, Rijan and Sushank. All of my questions have been answered. Very well done.

[00:20:25] Rijan Kapur Poudel & Sushank Jung Rawal:
Thank you so much, Mr. Lama. We really appreciate your time, questions, and guidance. We will follow up with the formal feedback request and next steps. Thank you everyone!
